Why Organic?

What is organic? Organic foods are foods that have been produced using ecological integrated practices without the use of synthetic chemicals, genetically engineered material, sewage, sludge or irradiation.

- Chemically dependent agriculture harms the environment and puts human health at risk. Pesticides, herbicides, and fertilizers from non-organic and non-conscious farmers run off into rivers, lakes and streams and contaminate the water supply and destroy the habitat. Thus creating toxic environments that jeopardize health and can lead to problems such as neurological issues, cancers, reproductive problems and more.
- Organic food tastes great.
- Organic food respects water sources.
- Organic farming helps build soil, not erode.
- Organic farmers work with nature and respect a health ecosystem.
- Organic farmers strive to preserve biodiversity by collecting seeds.
- Organic and natural farming helps family and community farms healthy and in business.
- Organic food is healthy and nutritious.
